## INSTALLATION

### 1

Check that the installation screed or existing flooring is clean and flat.

### 2

Install the first element, placing it perpendicular with the adjacent walls.

### 3

Continue installing, interlocking all elements on the right side, until the space is full.

### 4

When the first row is complete, start again from the beginning, always ensuring that the elements are perpendicular.

### 5

When done, cut elements to size around the edges if necessary.

### 6

Elements can be cut with a tile cutter or angle-grinder.

### 7

Cutting of the PUR using a jigsaw with laminate blade.

### 8

Fill any gaps between the elements and the wall with silicone.

For a successful tile installation, prepare the surface, measure accurately, gather the right tools, apply adhesive evenly, place the tiles with spacers, cut as needed, grout carefully, and consider sealing for protection. Follow manufacturer instructions and seek professional help if required.
